

Info sheet

HL lot cover made of recycled plastic

HL is increasingly trying to take measures to contribute to the fight against climate change and the protection of our environment. In addition to expanding the use of renewable energies and reducing energy consumption at the Himberg site, this also includes the use of recycled plastic. In this way, we want to save resources and also realize circular economy.

For the time being, the recycplate is only to be used for parts that are not permanently installed, such as lot covers, whose function only has to be fulfilled during the construction phase and which are disposed afterwards.

The recycled material has no disadvantages in terms of its composition, strength and durability compared to our conventional plastics. However, in the future there may be variations in the color of the parts in which recycled material is used. The color depends on which and how much recycled material has been used. The parts can have their original color (mostly red), but can also be produced in different shades of gray or even black.

This change affects the following items until further notice:

| Article Nr. | Original Color |
|-------------|----------------|
| 4000.0 | red |
| 04000.1E | red |
| 034.1E | red |
| 0570.0E | red |
| 0520.0E | red |
